Polytec takes over distribution of Cantronic OGI cameras

Polytec, a leading provider in the field of optical measurement technology, is expanding its portfolio and is taking over the distribution of optical gas imaging (OGI) cameras from the Canadian manufacturer Cantronic Systems for Europe with immediate effect.

With this partnership, the medium-sized company is expanding its expertise in the detection and visualization of gas leaks in order to provide even more comprehensive support to customers in industries such as oil and gas, chemicals and energy supply.

Dr. Dirk Samiec, Head of the Photonics Business Unit at Polytec, welcomes the cooperation: “The collaboration with Cantronic allows us to offer our customers first-class OGI technology. The cameras are characterized by their high precision, versatility and reliability - exactly the qualities our customers expect.”

The versatile models for portable, stationary and drone-based applications enable the detection of over 400 volatile organic compounds (VOCs) and methane. Thanks to the highly sensitive MWIR detectors, these cameras offer accurate and fast gas leak detection. Of particular note is the real-time visualization of gases, which enables an immediate response to potential hazards. The robust, corrosion-resistant designs ensure use even under extreme conditions.

As part of this cooperation, Polytec is not only responsible for sales, but also for comprehensive consulting, feasibility studies, training and services. The holistic support ensures that customers are optimally supported from the evaluation to the implementation of the technology.
